Intelligent Network Analyst

Sophisticated WAN Monitoring and Analysis in Real time

Masergy's Network Analyst gives you flexible tools to track your network traffic and application performance in a variety of ways. View and filter traffic by application, port, protocol, IP address and QoS service plane – or view “Top-Talkers,” which identifies the IP address pairs that generate the most traffic.

Our Network Analyst embeds network monitoring and reporting capabilities into your network service. Using data mirroring capabilities, Network Analyst stores packet header information on servers owned and maintained by Masergy. Simply activate the service and start viewing network traffic and application performance across your wide-area network (WAN).

Masergy Network Analyst has an industry-unique Active Network Map that displays the exchange of network traffic between your top 15 sites. From that map, you can identify the traffic patterns, flow direction, bandwidth utilization and recent changes in a single, comprehensive display.

FEATURES

- Easy-to-use, streamlined interface
- Flexible, granular reporting
- Configurable alarms and email alerts
- Extensive filtering capabilities
- Enhanced search capabilities
- Configurable applications
- Printer-friendly, customizable graphs
- Comprehensive view of traffic from Top 15 sites
- Export data functionality

BENEFITS

- Always available via web-based portal
- No deployment/management burden
- No software or hardware costs
- No bandwidth utilization
- No impact on latency
- Low monthly service fee
